resource crunch confronting energy supplies can be alleviated if we design and develop future buildings by incorporating sound concepts of energy efficiency and sustainability. Covering 41 projects from India's various climatic zones, this book provides thorough insights into the context, techniques, and benefits of energy-efficient buildings. The projects highlight design responses to varied climatic conditions, appropriate materials and construction methods, implementation of energy-efficient systems, and effective utilization of renewable energy to reduce pressure on grid power. This book will inspire

architects, designers, urban planners, engineers, and students to build for a better tomorrow.

Energy Efficiency and Human Activity - Lee Schipper
1992-11-19

This book, sponsored by the Stockholm Environment Institute and first published in 1992, presents a detailed analysis of changes in world energy use over the past twenty years. It considers the future prospects of energy demand, and discusses ways of restraining growth in consumption in order to meet environmental and economic development goals.

Based on a decade of research by the authors and their

colleagues at Lawrence Berkeley Laboratory in collaboration with the Stockholm Environment Institute, it presents a wealth of information on energy use and the forces shaping it in the industrial, developing, and formerly planned economies. The book provides an invaluable overview of the potential for improving energy efficiency, and discusses the policies that could help realize the potential. While calling for strong action by governments and the private sector, the authors stress the importance of considering the full range of factors that will shape realization of the energy efficiency potential around the

world.

substantially exceed current annual domestic energy supply. While historic improvements in energy intensity suggest great scope for energy conservation in the future, I argue that optimistic estimates of avoided energy costs due to energy conservation are likely biased downward. I then analyze a data set on energy intensity in the United States at the state level between 1970 and 2001 to disentangle the key elements of energy efficiency and economic activity that drive changes in energy intensity"--National Bureau of Economic Research web site.

This SpringerBrief reviews currently applied and potential solutions for improving the efficiency and quality of rural electricity supply in India, a major bottleneck for agricultural development. It provides background on the current state of supply and reviews recent and ongoing research and development projects. One selected project, designed and conducted by the authors, is outlined in detail. The research findings, project implementation, and evaluation are intended to provide development practitioners, policy makers, and applied researchers with

Technology (BIT). Energy efficiency, linking energy supply, demand and market, is crucial to the world's energy development. China consumes one fourth of the world's energy currently, however its per capital consumption is no more than half of that in OECD countries. This book provides a comprehensive treatment of the situation of China's energy development, proposes and summarizes the methodologies of energy efficiency measurement, and uses these methods to analyze the energy consumption at sectoral and provincial level, the impacts of economic structure on the energy macro-efficiency, the

price elasticity of oil demand, and energy efficiency policies simulations. The book provides scientific support for researchers and policy makers dealing with energy efficiency.

we reach by conducting the first large-scale study on cogeneration technology adoption - a prominent form of energy-saving investments - in the U.S. manufacturing sector, using a sample that runs from 1982 to 2010 and drawing on multiple data sources from the U.S. Census Bureau and the U.S. Energy Information Administration. We first show through a series of event studies that no differential trends exist in energy consumption nor production activities between adopters and never-adopters prior to the adoption event. We then compute a distribution of realized returns to energy

savings, using accounting methods and regression methods, based on our difference-in-difference estimator. We find that (1) significant heterogeneity exists in returns; (2) unlike previous studies in the residential sector, the realized and projected returns to energy savings are roughly consistent in the industrial sector, for both private and social returns; (3) however, cogeneration adoption decreases manufacturing output and productivity persistently for at least the next 7-10 years, relative to the control group. Our IV strategies also show sizable decline in TFP post adoption.

Review of Energy Efficiency Interventions - Asian Development Bank 2012-12-01
This evaluation focuses on the Asian Development Bank (ADB) interventions to stimulate energy efficiency investments in industry and buildings. Among the key findings is that energy pricing and market imperfections need to be addressed to promote energy efficiency investments. ADB and governments in developing member countries should support the removal of various

barriers to energy efficiency investments in Asia and the Pacific.

Energy Audit - Y. P. Abbi 2012-01-01

The availability of fossil fuels required for power plants is reducing and their costs increasing rapidly. This gives rise to increase in the cost of generation of electricity. But electricity regulators have to control the price of electricity so that consumers are not stressed with high costs. In addition,

environmental considerations are forcing power plants to reduce CO₂ emissions. Under these circumstances, power plants are constantly under pressure to improve the efficiency of operating plants, and to reduce fuel consumption. In order to progress in this direction, it is important that power plants regularly audit their energy use in terms of the operating plant heat rate and auxiliary power consumption. Energy Audit of Thermal Power, Combined Cycle, and Cogeneration Plants attempts to refresh the fundamentals of the science and engineering of thermal power plants, and establishes its link with the real

power plant performance data through case studies, and further developing techno-economics of the energy efficiency improvement measures. This book will rekindle interest in energy audits and analysis of the data for designing and implementation of energy conservation measures on a continuous basis.

California Energy Efficiency - Arik Levinson 2013

Starting in the 1970s California's residential electricity consumption per capita stopped increasing, while other states' electricity use continued to grow steadily. Similar patterns can be seen in non-electric energy, industry, and transportation.

What accounts for California's apparent energy savings?

Some credit the strict energy efficiency standards for buildings and appliances enacted by California in the mid-1970s. They argue that other states and countries could replicate California's gains, and that California should build on its own success by tightening those standards further.

Skeptics might point to three long-run trends that differentiate California's electricity demand from other states: (1) shifting of the U.S. population towards warmer climates of the South and West; (2) relatively small income elasticity of energy demand in California's

temperate climate; and (3) evolving differences between the demographics of households in California and other states. Together, these trends account for around 90 percent of California's apparent residential electricity savings, thus providing no lessons for other states or countries

considering adopting or tightening their energy efficiency standards.
