Liquid Filtration is a state-of-the-art review of liquid filtration in the chemical process and allied industries. Interpretations of the phenomenological observations of the hydrodynamics of filtration are given in the hopes of establishing more theoretical and generalized bases of design methodology. Specific design and selection criteria are reviewed, and typical industrial problems and their solutions are presented. Nicholas Cheremisinoff is known internationally as one of the foremost engineers with Exxon and as the author of numerous books, articles and periodical contributions. Most recently his international consulting role has seen him active the Ukraine, part of the former Soviet Union, where the modernising of these industrial processes has been key. Liquid Filtration is a fundamental unit operation extensively practiced throughout the chemical process, petroleum, and allied industries. It involves the separation, removal, and collection of a discrete phase of matter existing in a dispersed or colloidal state in suspension. This separation is most often performed in the presence of a complex media structure in which physical, physiochemical and/or electrokinetic forces interact. The GCC Economies - Mohamed A. Ramady 2012-04-23

The 'Arab Spring' of 2011 has affected the countries of the region to varying degrees, including the Gulf Cooperation Council (GCC) members, comprising Saudi Arabia, Kuwait, Qatar, the United Arab Emirates, Oman and Bahrain. The GCC has become a significant regional bloc playing a vital economic and political role far beyond its shores, given its geopolitical strategic location, a preponderance of global energy reserves and a major international player through the use of accumulated financial reserves. A new Gulf is rising, one that is more self assertive, looking to expand its membership to other Arab countries such as Jordan and Morocco, while at the same time strengthening the bloc's relationship with current and emerging trading and strategic partners in Europe, USA and Asia. Regional and international realities, especially the uncertainties unleashed by the 'Arab Spring', are forcing Gulf leadership to initiate new policies involving closer cooperation amongst GCC countries to address emerging challenges. This volume brings together thirty renowned academics and specialists to examine a range of multifaceted social, political and economic issues facing the GCC in key areas such as: · Diversification from a high dependency on a narrow hydrocarbon base · Social transformation, youth employment and effective gender participation · Outward and inward foreign direct investment flows · Prospects for education reforms and e-learning. · Sustainable security in oil, renewable energy (including nuclear) and food · Corporate governance, transparency and enhancing the private sector's operating environment · The role and governance of Gulf Sovereign Wealth Funds in investing their surpluses. The volume also offers insights for challenges facing the GCC in monetary union, expanding the regional debt market and Sukuk issuance, GCC intellectual property rights application, detailed assessments of individual GCC country risk analysis, as well as the sustainability of long term government fiscal stimulus programs at the expense of private sector involvement.

Practical Engine Airflow - John Baechtel 2015-12-15

The efficient flow of air through an engine is instrumental for producing maximum power. To maximize performance, engine builders seek to understand how air flows through components and ultimately through the entire engine. Engine builders use this knowledge and apply specific practices and principles to unlock horsepower within an engine; this applies to all engine types, including V-8s, V-6s, and imported 4-cylinder engines. Former Hot Rod magazine editor and founder of Westech Performance Group John Baechtel explains airflow dynamics through an engine in layman's terms so you can easily absorb it and apply it. The principles of airflow are explained; specifically, the physics of air and how it flows through major engine components, including the intake, heads, cylinders, and exhaust system. The most efficient and least restricted path through an engine is the key to high performance. To get to this higher level, the author explains atmospheric pressure, air density, and brake specific fuel consumption so you understand the properties of fuel for tuning. Baechtel covers the primary factors for optimizing the airflow path. This includes the fundamentals of air motion, air velocity, and boundary layers; obstructions; and pressure changes. Flowing air through the heads and the combustion chamber is key and is comprehensively explained. Also comprehensively explored is the exhaust system's airflow, in particular primary tube size and length, collector function, and scavenging. Chapters also include flowbench testing, evaluating flow numbers, and using airflow software. In the simplest terms, an engine is an air pump. Whether you're a professional engine builder or a serious amateur engine builder, you must understand engine airflow dynamics and must apply these principles if you want to optimize performance. If you want to achieve ultimate engine performance, you need this book.

The Wrong Girl - David Hewson 2015-05-07

By the bestselling author of The Killing, The Wrong Girl is the second novel in David Hewson's gripping Detective Pieter Vos series set in Amsterdam. Sinterklaas, a beaming, friendly saint with a white beard, was set to mark his arrival in Amsterdam with a parade so celebrated it would be watched live on television throughout the Netherlands. Today the crowds would run into three hundred thousand or more, and the police presence top four figures. The city centre was closed to all traffic as a golden barge bore Sinterklaas down the Amstel river, surrounded by a throng of private boats full of families trying to get close.' Amsterdam is bursting at the seams with children trying to get a glimpse of their hero and families enjoying the occasion. The police are out in force, struggling to manage the crowds on one of the busiest days of the year. Brigadier Pieter Vos is on duty with his young assistant, Laura Bakker, when the first grenade hits. As Sinterklaas prepares to address the crowds a terrorist outrage grips the heart of the city. In the chaos a young girl wearing a pink jacket is kidnapped. But the abducted child isn't the daughter of an Amsterdam aristocrat as the terrorists first thought. She's the daughter of an impoverished Georgian prostitute, friendless and trapped in the web of vice that is Amsterdam's Red Light District. As the security forces and the police clash over the ensuing investigation the perpetrator's horrifying demands become clear. Vos, trapped in a turf war with state intelligence, tries to unravel a conspiracy that reaches from the brothels of the city to the hierarchy of the security services. And at its heart lies an eight-year-old girl, snatched from a loving mother then ferried from one criminal lair to the next, her life in the balance as Vos and Laura Bakker struggle to uncover the shocking truth behind her abduction. What is the life of one immigrant child worth in the greater political game emerging around them?

Diffraction Effects in Semiclassical Scattering - H. M. Nussenzveig 2006-04-20

Critical effects in semiclassical light scattering, in which the standard approximations break down, are associated with forward peaking, rainbows, glories, orbiting, and resonances. Besides giving rise to beautiful optical effects in the atmosphere, critical effects have important applications in many areas of physics. Their interpretation and accurate treatment, however, are difficult. This book deals with the theory of these critical effects. After a preliminary chapter posing the problem of critical effects, the next three chapters on coronae, rainbows, and glories, are written to be accessible to a broader audience of physicists. The main part of the book then describes the results obtained from the application of complex angular momentum techniques to scattering by homogeneous spheres. These techniques lead to practically usable asymptotic approximations, and to new physical insights into critical effects. A new conceptual picture of diffraction, regarded as a tunnelling effect, emerges. The final two chapters contain brief descriptions of applications to a broad range of fields including linear and nonlinear optics, radiative transfer, astronomy, acoustics, seismology, atomic, nuclear, and particle physics. This book intends to convey the basic concepts and physical interpretations that emerge from the new approach, rather than the complete formalism.
